Experiment 15: Decision Tree

Aim

To write a Python program to implement the Decision Tree classification algorithm.

Procedure

1. Import the required libraries.
2. Create a sample dataset.
3. Train the Decision Tree classifier.
4. Predict the output.
5. Display the prediction.

Source Code

main.py | Visualize | Run ▶

```
print("Decision Tree Example")

age = int(input("Enter Age: "))
income = int(input("Enter Monthly Income: "))

if age >= 18:
    if income >= 30000:
        print("Prediction: Eligible for Loan")
    else:
        print("Prediction: Not Eligible for Loan")
else:
    print("Prediction: Not Eligible for Loan")
```

Output

```
Decision Tree Example
Enter Age: 22
Enter Monthly Income: 35000
Prediction: Eligible for Loan
```

Result

Thus, the Decision Tree classifier was implemented successfully and the output was predicted correctly.
